DETAILED ACTION

Continued Examination Under 37 CFR 1.114

1. A request for continued examination under 37 CFR 1.114, including the fee set forth in 37 CFR 1.17(e), was filed in this application after final rejection. Since this application is eligible for continued examination under 37 CFR 1.114, and the fee set forth in 37 CFR 1.17(e) has been timely paid, the finality of the previous Office action has been withdrawn pursuant to 37 CFR 1.114. Applicant's submission filed on April 20, 2004 has been entered.

Response to Amendment

2. Amendments to claims 1 and 4 have been entered in the above-identified application. Claim 15 has been cancelled. **Claims 1-14 and 16-18 are now pending.**

Claim Rejections - 35 USC § 102

The following is a quotation of the appropriate paragraphs of 35 U.S.C. 102 that form the basis for the rejections under this section made in this Office action:

A person shall be entitled to a patent unless –

(b) the invention was patented or described in a printed publication in this or a foreign country or in public use or on sale in this country, more than one year prior to the date of application for patent in the United States.

3. Claims 1-14 and 16-18 are rejected under 35 U.S.C. 102(b) as being anticipated by Dobry et al. (US 2,962,081).

Dobry et al. disclose plastic composition sheets that are adapted for use as floor coverings wherein the process of making such a plastic composition sheet entails depositing uniformly on a backing material a smooth layer of a mixture of fine particles and flat plastic chips (Column 1, lines 49-65). The plastic chips are about 0.18 to 1.0 inches in diameter (equivalent to 4.57 to 25.40 mm) and have a thickness of 0.01 to 0.025 inches (equivalent to 254-635 microns) (Column 2, lines 37-45). The process of the disclosed invention is applicable to various types of plastic compositions used in surface coverings including linoleum (Column 2, lines 71-72). If the plastic composition is linoleum then the linoleum is composed of drying oils, resin, fillers and pigments. The oil can be linseed oil. The resin can be rosin or ester gum. The thickness of the plastic layer can be varied and is typically 0.02 to 0.06 inches in thickness (Column 6, lines 11-31, 70-75). Typical of other suitable resins are polymethyl methacrylates (Column 5, lines 27-30). Figure 2 is a cross-sectional view of the surface covering and specifically shows that the plastic chips (10) are imbedded in the matrix of fine granules (11) and wherein a backing material (20) is also present. All limitations of claims 1-14 and 16-18 are disclosed in the above-recited reference.
